

# I. Matter vs. Energy

$$E = mc^2$$

## Matter

- Has mass & takes up space
- Affected by gravity
- Consists of elements and compounds

## Energy

- Moves matter
- *↪ based on position* Potential, kinetic
- *↪ based on movement* Ability to do work
- *↪ Gibbs free energy* Conversions
- *↪* Sound, light, heat

## Element

- “pure” substance  
*Based on # of protons*
- Can’t be broken down by “ordinary” means to another substance
- Ex. hydrogen (H), nitrogen (N)

## Compound

- 2 or more different elements combined in a fixed ratio
- Ex.  $H_2O$ ,  $CO_2$   
water  $O_2 \rightarrow$  diatomic element

# Elements of Life

- **25 elements** → found in organic materials 118 elements
- **96% : O, C, H, N** → O - oxygen C - carbon  
H - hydrogen N - nitrogen
- ~ 4% : P, S, Ca, K & trace elements (ex: Fe, I)  
↳ bone phosphorous sulfur

Hint: Remember **CHNOPS**

why O, C, H, N? water is  $H_2O$

material → macromolecules

Σ fats, proteins, nucleic acids, sugar  
carbohydrates

**Table 2.1** Elements in the Human Body

Element	Symbol	Percentage of Body Mass (including water)	
Oxygen	O	65.0%	} <i>macromolecules</i> <u>96.3%</u>
Carbon	C	18.5%	
Hydrogen	H	9.5%	
Nitrogen	N	3.3%	
Calcium	Ca	1.5%	} 3.7%
Phosphorus	P	1.0%	
Potassium	K	0.4%	
Sulfur	S	0.3%	
Sodium	Na	0.2%	
Chlorine	Cl	0.2%	
Magnesium	Mg	0.1%	
<u>Trace elements</u> (less than 0.01% of mass): Boron (B), chromium (Cr), cobalt (Co), copper (Cu), fluorine (F), iodine (I), iron (Fe), manganese (Mn), molybdenum (Mo), selenium (Se), silicon (Si), tin (Sn), vanadium (V), zinc (Zn) <i>≈ 25 elements</i>			

# II. Atomic Structure

matter is mostly space

- Atom = smallest unit of matter that retains properties of an element

- Subatomic particles:

dense nucleus

	Mass (dalton or AMU)	Location	Charge
<u>neutron</u>	1	nucleus	0 neutral
<u>proton</u>	1	nucleus	+1
electron	<u>negligible</u>	shell orbital	-1

relatively big

1/2000 of a proton mass

Element Helium

Different elements  
have a different number  
of protons.

Mass # (protons + neutrons)  
of protons.

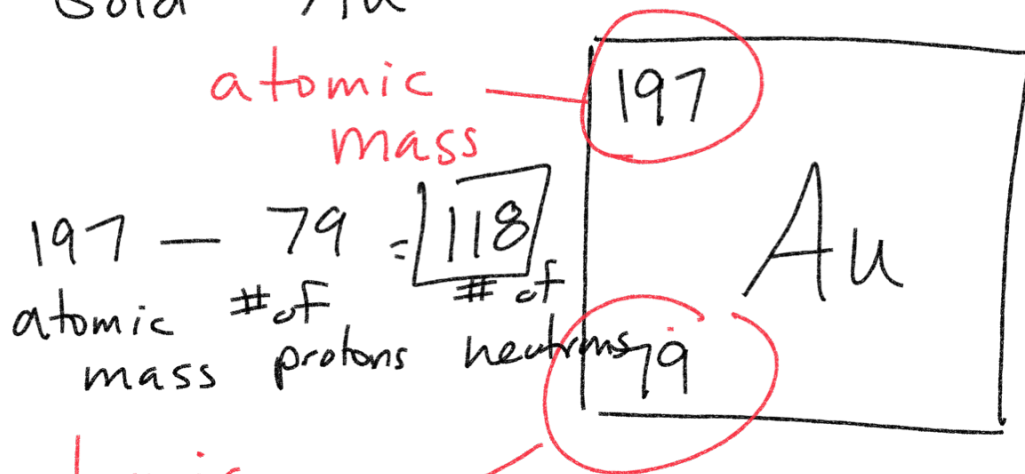

symbol

Atomic # (protons or  
electrons)

# of protons

# T-GB General Biology Week 3 9/19

Gold Au

protons: 79  
electrons: 79  
neutrons: 118

atomic number = # of protons

In a neutral element, number of protons is equal to the number of electrons

# Isotopes

- # neutrons varies, but same # of protons
- Radioactive isotopes used as tracers (follow molecules, medical diagnosis)
- Uncontrolled exposure causes harm

TABLE 2.4 ISOTOPES OF CARBON			
	Carbon-12	Carbon-13	Carbon-14
Protons	6	6	6
Neutrons	6	7	8
Electrons	6	6	6

# Electrons exist only at fixed levels of potential energy called electron shells or orbitals

energy exists in small units called quanta

(a) A ball bouncing down a flight of stairs can come to rest only on each step, not between steps.

Third shell (highest energy level in this model)

Second shell (higher energy level)

First shell (lowest energy level)

Atomic nucleus

# III. Chemical Bonds

## Strongest Bonds:

### 1. Covalent: sharing of $e^-$

- Polar: covalent bond

between atoms that differ in

*unequal sharing*  
electronegativity

▪ Eg.  $H_2O$

- Nonpolar:  $e^-$  shared equally;

▪ Eg.  $O_2$  or  $H_2$

*equal sharing*

*sharing of outer electrons or valence electrons*

*outermost orbital or shell is the valence shell*

Name and Molecular Formula	Electron Distribution Diagram	Structural Formula	Space-Filling Model
(a) Hydrogen ( $H_2$ )		H—H <i>covalent bond very strong</i>	
(b) Oxygen ( $O_2$ )		O=O	
(c) Water ( $H_2O$ )		O—H   H	
(d) Methane ( $CH_4$ )		H   H—C—H   H	

# III. Chemical Bonds

## Strongest Bonds:

2. Ionic: 2 ions (+/-) bond (givers/takers) *noncovalent bonds—do not involve electron sharing*

- $\text{Na}^+\text{Cl}^-$
- Affected by environment (eg. water)
